

How It Works

We will take “before” measurements and photos to record your progress. The trained technician focuses a round ultrasonic amplifier around the area being treated which delivers ultrasonic energy to subcutaneous fat. The ultrasonic waves burst the fat cell membranes and “melts” the fat. This then passes through the lymphatic system and leaves the body through the liver within 2-3 weeks after the procedure. The machine consists of two ultrasonic heads and electrode pads. All three are pain free and intensity is adjusted for every individual to meet their specific needs. The first ultrasonic head has a high frequency current, which only targets fat cells and destroys them. Once destroyed they cannot grow back. The second ultrasonic head is a low frequency process which melts down the fat and makes it easier to stream through the lymphatic system into the blood stream for disposal. The electrode pad tightens and firms the area, helping to sculpture the body.

The ultrasonic waves destroy fat cells in the area that is being treated FOREVER. Noticeable results in problem areas may be achieved in as few as 4-6 sessions. A course of 6 to 20 sessions are recommended for best results, this will depend on the individual and the area being treated. The area being treated will continue to decrease fat cells for 3 months after the procedure without any further assistance.

We all know that for our bodies to look their best, we need to follow a healthy diet and ensure that we take regular exercise. However for some of us this still doesn't always give us the body and shape we crave or desire. Ultrasonic liposuction is a really effective method of giving your body that extra boost to remove stubborn pockets of fat that just won't disappear despite working out in the gym or taking regular exercise. One treatment can remove upto a pound of fat or 1.5 inches from the area being treated, depending on the individual.

The treatment should not be thought as a “quick fix”. In order for the treatment to work as its best you also need to commit to certain changes in lifestyle. In between sessions you could follow a low carbohydrate diet and drink plenty of water. You must avoid alcohol for at least 4 days after the treatment and exercise to encourage lymph flow, which supports for removal of fat cells from the body. If you don't follow the lifestyle changes recommended, it is likely that you will gain more weight but it will just show up in another area of the body which has not been treated.
